digicard hotel

Networked 20x
Card Reader for Authentication

Multi-card reader, support digiDL remote download, ideal for analysis bureau

Key Features

- Host multiple company cards (up to 20 per unit)
- Supports multiple organisations and accounts
- Used only in conjunction with digicentral
- Totally self-contained processing and management

Hosting multiple company cards

digicard-hotel is a complete stand-alone solution for hosting multiple company cards for authentication of remote download products (i.e. **digiDL**). It has its own processing and network connection for hosting up to 20 company cards. **digicard-hotel** utilises **digicentral** to communicate with remote download devices.

This allows any analysis bureau supporting the **digicentral** platform to manage multiple company cards. This reduces the need for support as there is no need to deal with a customer's network or issues arising from user interference.

Full management control

digicard-hotel can be plugged into the local network and will configure itself using DHCP.

The browser based management tools can be accessed locally or remotely depending on configuration. It is also possible to connect a standard **digifob** to the unit which acts as a simple keypad and screen. This is ideal for initial setup particularly if you require the use of a Static IP.
