# DLButton

A button to trigger remote download when connected with digiDL

## Key Features

- A useful tool to trigger a driver card download
- Allows for downloads outside of schedule
- Timely download when you need it

A great solution for triggering the download of driver card data at the end of a shift. The button gives you the flexibility to activate a download outside of your regular download schedule.

## Set up

Insert the button's connector in the digiDL AUX socket. Fit the button to an appropriate location within the vehicle. We recommend fitting to the blanking panel that is likely to be concealing the **digiDL**.

## How to use

Press the button to trigger the download. This will only download the driver card in the first slot of the tachograph.

LED	Status
Green Flashing	Download has been requested. Waiting to begin
Green/Red Alternating	Download in progress
Green	Download successful
Red	Download failed

The **digiDL** needs to authenticate and complete any outstanding tasks from **digicentral** before it can download a newly inserted driver card. We therefore recommend leaving a few minutes with the ignition on and the driver card inserted before using the button to trigger the download.
